

# Pursuit of Value-added Products

## Development of new drug products with less bitter and better flavors

We are developing coating technologies to reduce bitterness and are improving taste with flavors like green tea and strawberry to make drugs easier to take.

## Improvement of stability

We are improving our products' stability against temperature, humidity and light. We continue to update and improve our products after launch.

## Tabletization of Capsules

We are promoting a change from capsules to tablets to make it easier for patients to take their medicines.

## Development of Orally Disintegrating (OD) tablets

For those who have difficulty in swallowing and/or concern about a full bladder at night, we are developing OD tablets that can be taken without water.

## Improvement of tablet score-lines

We are devising pre-scored tablets for easy-splitting of medications in half, improving precision when prescribed and dispensed.

## Improvement of packaging

We are working to ensure safety, prevent errors and reduce the burden of dispersing medication for healthcare practitioners by developing prefilled syringes and bag forms. We are also improving the packaging of existing products.

## Improvement of visibility

The ingenuity can be seen in practices, such as printing / laser printing generic names (the active ingredient name) on tablets and capsules, to improve distinguishability and prevent errors during treatment.
